

Sentiment Analysis of KUET Student Feedback

Md Zunaied Nudar Roll: 2107041

Kazi Rifat Al Muin Roll: 2107042

1 Introduction

Students regularly share opinions, feedback, complaints, and concerns about academic activities, campus facilities, food, transportation, accommodation, administration, and other university services. A large amount of this feedback is available through student communities, social media, and direct responses, but analyzing it manually is difficult and time-consuming. This project proposes an NLP-based system to automatically analyze KUET student feedback and classify its sentiment as **Positive, Neutral, or Negative**. Such analysis can provide a structured view of student opinions and help identify common sentiment patterns across different university-related issues.

2 Project Description

The project will collect student feedback from KUET-related online communities, student contributions, anonymous posts, and anonymous survey forms. The collected text will be anonymized, cleaned, and manually labeled into three sentiment classes: **Positive, Neutral, and Negative**. An NLP-based classification model will then be trained and evaluated using the labeled dataset. Finally, a simple demo application will allow a user to enter feedback and obtain its predicted sentiment.

3 Objectives

1. Develop a labeled dataset of KUET student feedback.
2. Train and evaluate an NLP-based sentiment classifier.
3. Develop a simple system for real-time sentiment prediction.

4 Data Collection

Feedback will be collected from the following sources:

- KUET-related student groups and online communities.
- Anonymous posts containing student opinions or feedback.
- Feedback voluntarily submitted by KUET students.
- Anonymous online survey forms distributed among students.

The collected data will be anonymized and cleaned before use. Names, student IDs, email addresses, phone numbers, and other personally identifiable information will be excluded from the dataset.

5 Proposed Workflow

6 Use of the System

The system can automatically analyze a large amount of student feedback and identify whether the expressed sentiment is positive, neutral, or negative. This can help understand student perceptions of areas such as academic services, campus facilities, food, transportation, accommodation, and administration. The resulting KUET-specific dataset can also be useful for future NLP research and development of student-focused applications.

7 Expected Outcome

The project is expected to produce a KUET-specific labeled student feedback dataset, an evaluated NLP sentiment classifier, and a simple demonstration system capable of predicting the sentiment of new student feedback as **Positive, Neutral, or Negative**.
